MEMORANDUM

TOP SECRET

SUBJECT: The Military Signi Missila Bases in Cuba

- 1. The presence of 24 1,020 n.m. MRBM launchers and 12 or 15 2,200 n.m. IREM launchers in Cuba provides a significant accretion to Soviet strategic capabilities for striking the continental United States, In view of the relatively limited numbers of Soviet operational ICBM launchers--at present an estimated 75--the missiles in the Caribbean will increase the first-strike missile salvo which the USOR could place on targets in the continental United States by over 40 percent.
- 2. At present, 20 of the 24 MRBM lauachers are believed to be fully operational, and the remaining four will be within a few days. The first 4 RBM launchers will probably reach an emergancy capability on November 15, and full operational status on December 1. The 8 other confirmed IRBM launchers will probably reach emergency capability by December 1, and be fully operational by December 15. An additional four IRBM launchers will probably be completed, but it is possible that the guarantine has stopped them. The current threat is thus 24 MRBMs; by December it will--unless construction is effectively stopped within a month-be augmented by at least 12 and up to 16 IRBMs. Each launcher is assumed to have the standard two missiles, allowing one relaid (for refire in 4-6 hours). In at least one of the sine bases more missiles than launchers have been positively confirmed, and in general the number of identified MRBM missiles at least is sufficient to man all the launchers for an initial strike. Earth-covered bunkers suitable for storage or checkout of nuclear weapons are under rapid construction, and at least two of then now appear to be complete. There is one such bunker for each pair of launch sites.
- 3. The strategic significance of the Suban missile complex is due not only to the substantial quantitative increase in negations deliverable in a surprise first strike, but also by their effect on the US deterrent striking force. Approximately 40 percent of the SAC tomber force is now located on air bases within range of Soviet MRSMs in Ouba, and almost all of it is in range of the IRBMs. If the present base complex in Subs is completed late in 1962 and taking into account the estimated Soviet ICEM force for the end of 1962, a Soviet attack without warming could destroy an appreciably larger proportion of over-all United States strategic capability than it could if the Guben complex were not included.

The number of US weapons surviving and ready to retaliate on targets in the USSR would be decreased by about 30 percent, and would thus leave only about 15 percent of the number in our pre-attack force. This force could still cause considerable destruction in a US retaliatory strike, the Soviets could not rely on the degree of surprise assumed in the above calculation, and it is very unlikely that the Soviets would be tempted toward resort to war by the change in the military balance. Nonetheless, this represents a serious dilution of US strategic deterrent capability.

- 4. The reasons for the strategic significance of the Cuban bases are: (a) the size of the Soviet ICBM force does not allow coverage of SAC bomber bases and soft ICBM sites; the addition of the MRBM/IRBM force already on the island of Cuba does permit coverage of all such points, thus bringing under fire an additional 26 US ICBMs and over 100 B-47's; (b) the Cuban based missile systems have high reliability (80 percent), accuracy (1 to 1.5 n.m. CEP), and warhead yield (up to 3 megatons each for the MRBMs, and up to 5 megatons for the IRBMs); (c) the Thited States does not have BMEMs or other early warning radar on the southern approaches; and (d) as taken into account earlier, many SAC bomber bases are concentrated in the South and Midwest.
- 5. All of the discussion above is concerned with the missile complex now being completed in Guba. There is no reason why the Suriets could not, if unimpeded by an effective quarantine, literally multiply the number of launchers to a force large enough to threaten the entire strategic balance of power. The Soviets have deployed over 500 MRBMs and IRBMs on their own territory, and the lesser cost compared to ICBMs would make a major expansion in Guba very attractive.

Raymond L. Garthoff Special Assistant for Soviet Bloc, Office of Politics - Military Affairs

HEMORALIDUM

TO: G - Mr. U. Alexis Johnson

FROM:

SUBJECT: Military Emportance of the Seviet Missile Bases in Cuba

The attached memoranda have been written at my request by Ray Garthoff. One, at the Top Secret level, sets forth the military significance of the missile cases for the guidance of senior Department officers. The second is an unclassified version, in which IO has indicated an active interest for background use by USUN, and which may be useful also for USIA, r, and for guidance of senior officers in discussion with outside contacts. The objectives of US dislomacy have been taken into account in framing it.

MEMORANDUM

SUBJECT: The 'Slitery Significance of the Soviet Rissile Bases in Cube

1. The presence of [24] 1,020 n.m. LREM launchers and [12 or 16] 2,200 n.m. LREM launchers in Guba provides a significant accretion to Soviet strategic capabilities for striking the continental United States. In view of the relatively limited numbers of Soviet operational ICBM launchers (at present an estimated 75) the missiles in the Caribbean will increase the first-strike missile salve which the USAR could place on targets in the continental United States by over 40 percent.

- 2. At present, 20 of the 24 IRBN launchers are believed to be fully operational, and the remaining four will be within a few days. A The lar confirmed IRBN launchers will probably reach emergency capability by December 1, and be fully operational by December 15. An additional four IRBN launchers will probably be completed, but it is assible that the quarantine has stopped then. The current threat is thus 24 IRBNs; in December it will—unless construction is effectively stopped within a month—to augmented by at least 12 and up to 16 IRBNs. Each launcher is assumed to have the standard two missiles, allowing one reload (for refire in 4 6 sours). In at least one of the mine bases more missiles than launchers have been positively confirmed, and in general the number of identified IRBN missiles at least is sufficient to man all the launchers for an initial strike. Earth covered bunkers suitable for storage or check-out of nuclear weapons are under rapid construction, and at least two of them now appear to be complete. There is one such bunker for each sir of launch sites.
 - 3. The strategic significance of the Juban missile conflow is due not only to the substantial quantitative increase in magazone deliverable in a surprise first strike, but also by their effect on the US laterent striking force. Agarominately all percent of the SAC bother force is now located on air bases within range of Saviet (RBMs in Oxfa, and almost all of it is in range of the IRSMs. If the present base somplem in Guba is complete late in 1962, and thoring into account the actimated Saviet IRSM force for the end of 1960, a Joviet strate without warning doubt destroy an approximately larger projection of over-all VI strategic capability than it could if the Guban complex were not included.
